What Does The Series $\sum_{n=1}^{\infty} (\frac{a}{b})^n$ Converge To?

Well,
$$\sum_{n=1}^{\infty} (\frac{a}{b})^n = \frac{a}{b-a}$$
 where $a, b \in \mathbb{N}, b \neq 0$ and $a < b$ (so $b - a \neq 0$). OK, but why?

Here's one way to think about it:

$$S = \sum_{n=1}^{\infty} \left(\frac{a}{b}\right)^n \qquad \# \text{ define } S$$

$$= \left(\frac{a}{b}\right)^1 + \left(\frac{a}{b}\right)^2 + \left(\frac{a}{b}\right)^3 + \cdots \qquad \# \text{ expand series}$$

$$\Rightarrow \left(\frac{b}{a}\right) \cdot S = \left(\frac{b}{a}\right) \cdot \left[\left(\frac{a}{b}\right)^1 + \left(\frac{a}{b}\right)^2 + \left(\frac{a}{b}\right)^3 + \cdots\right] \qquad \# \text{ multiply both sides by } \frac{b}{a}$$

$$\Rightarrow \left(\frac{b}{a}\right) \cdot S = 1 + \left(\frac{a}{b}\right)^1 + \left(\frac{a}{b}\right)^2 + \left(\frac{a}{b}\right)^3 + \cdots \qquad \# \text{ multiply through on right side}$$

$$\Rightarrow \left(\frac{b}{a}\right) \cdot S = 1 + S \qquad \# \text{ definition of } S$$

$$\Rightarrow \left(\frac{b}{a}\right) \cdot S - S = 1 \qquad \# \text{ subtract } S \text{ from both sides}$$

$$\Rightarrow \left(\frac{b}{a}\right) \cdot S - \left(\frac{a}{a}\right) \cdot S = 1 \qquad \# \text{ multiply } S \text{ by } 1 = \frac{a}{a}$$

$$\Rightarrow S \cdot \left[\frac{b}{a} - \frac{a}{a}\right] = 1 \qquad \# \text{ factor out } S$$

$$\Rightarrow S \cdot \left[\frac{b-a}{a}\right] = 1 \qquad \# \text{ simplify}$$

$$\Rightarrow S = \frac{a}{b-a} \qquad \# \text{ multiply both sides by } \frac{a}{b-a}$$

So
$$S = \sum_{n=1}^{\infty} (\frac{a}{b})^n = \frac{a}{b-a}$$
 where $a, b \in \mathbb{N}, b \neq 0$ and $a < b$.

For example, if we let
$$a = 1$$
 and $b = 2$ then $\sum_{n=1}^{\infty} (\frac{1}{2})^n = \frac{1}{2-1} = 1$. Similarly, if $a = 1$ and $b = 3$ then $\sum_{n=1}^{\infty} (\frac{1}{3})^n = \frac{1}{3-1} = \frac{1}{2}$.

Acknowledgements

Thanks to Dave Neary who pointed out that the series diverges if $a \geq b$.
